ABOUT ME

钟雨婷
ZOEY ZHONG

I am an MA Communication Design student working across UI/UX, visual communication, editorial design and interactive experiences. I translate research and complex topics into clear, engaging visual systems and digital experiences. My interests include digital products, emerging technologies and socially engaged design, and I am currently seeking design internship opportunities in Shenzhen.

Beyond the Interface

PROJECT TYPE: UI/UX Design · Mobile Interface · Information Visualisation

This project addresses the invisibility of the physical and environmental systems behind everyday generative AI use, which allows each response to appear instant and immaterial.

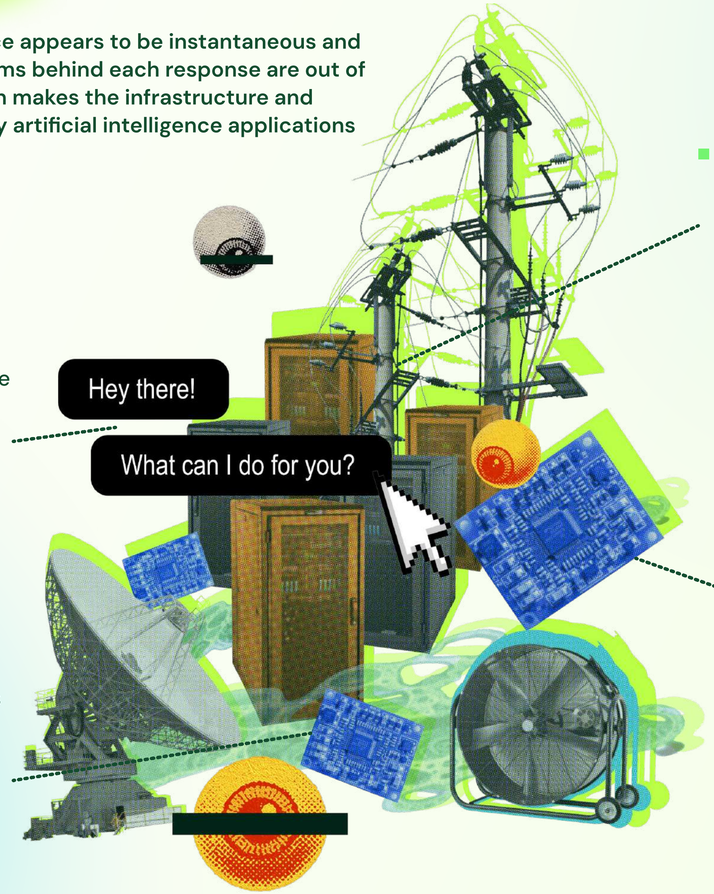

The mobile interface reveals the processes of computation, electricity, cooling and data transfer, translating these hidden systems into a sequence of visible stages and resource traces.

By visualising what happens behind each generated response, the project encourages users to reflect before generating again and reconsider the material consequences of everyday AI use.

Background

Generative artificial intelligence appears to be instantaneous and invisible, as the physical systems behind each response are out of the user's view. This separation makes the infrastructure and resources supporting everyday artificial intelligence applications easily overlooked.

INVISIBLE INFRASTRUCTURE

The simple dialogue interface conceals the physical operations during the generation process, making artificial intelligence appear effortless and unrestricted.

COMPUTATION

Servers and dedicated chips handle each request, consuming electricity and generating heat before the answer reaches the screen.

DATA NETWORKS

Artificial intelligence relies on data centers, power grids, and communication networks to process and transmit information between different physical locations.

COOLING SYSTEMS

Computing devices require continuous cooling, which may involve fans, airflow, water, and additional energy.

Research

How can we, through communication design, make the hidden material and environmental costs involved in the daily use of generative AI visible and concrete, thereby encouraging users to reflect before generating again?

MAPPING THE HIDDEN PROCESS

Key Finding

The evidence indicates that generative artificial intelligence relies on electricity, cooling systems, data centers and physical hardware. Due to the varying impacts of different models, infrastructure and requests, it is impossible to represent all situations with a single data on energy or water resources.

Mind map

Summary

The mind map identified three possible directions: visualizing the hidden infrastructure, introducing reflective friction, and converting digital activities into physical feedback. These ideas provided guidance for the initial interface experiment.

First Sketches

Design Concept

Ultimately, I want to create a small desktop interface and device that can visualize and materialize the hidden physical system behind generative artificial intelligence. This interface will display the generation process and resource information, while the device will convert computing, power, cooling, and cumulative usage into light, airflow, sound, and continuously accumulating paper traces. After each response to the generation, the dynamic feedback will stop, but the paper traces will persist.

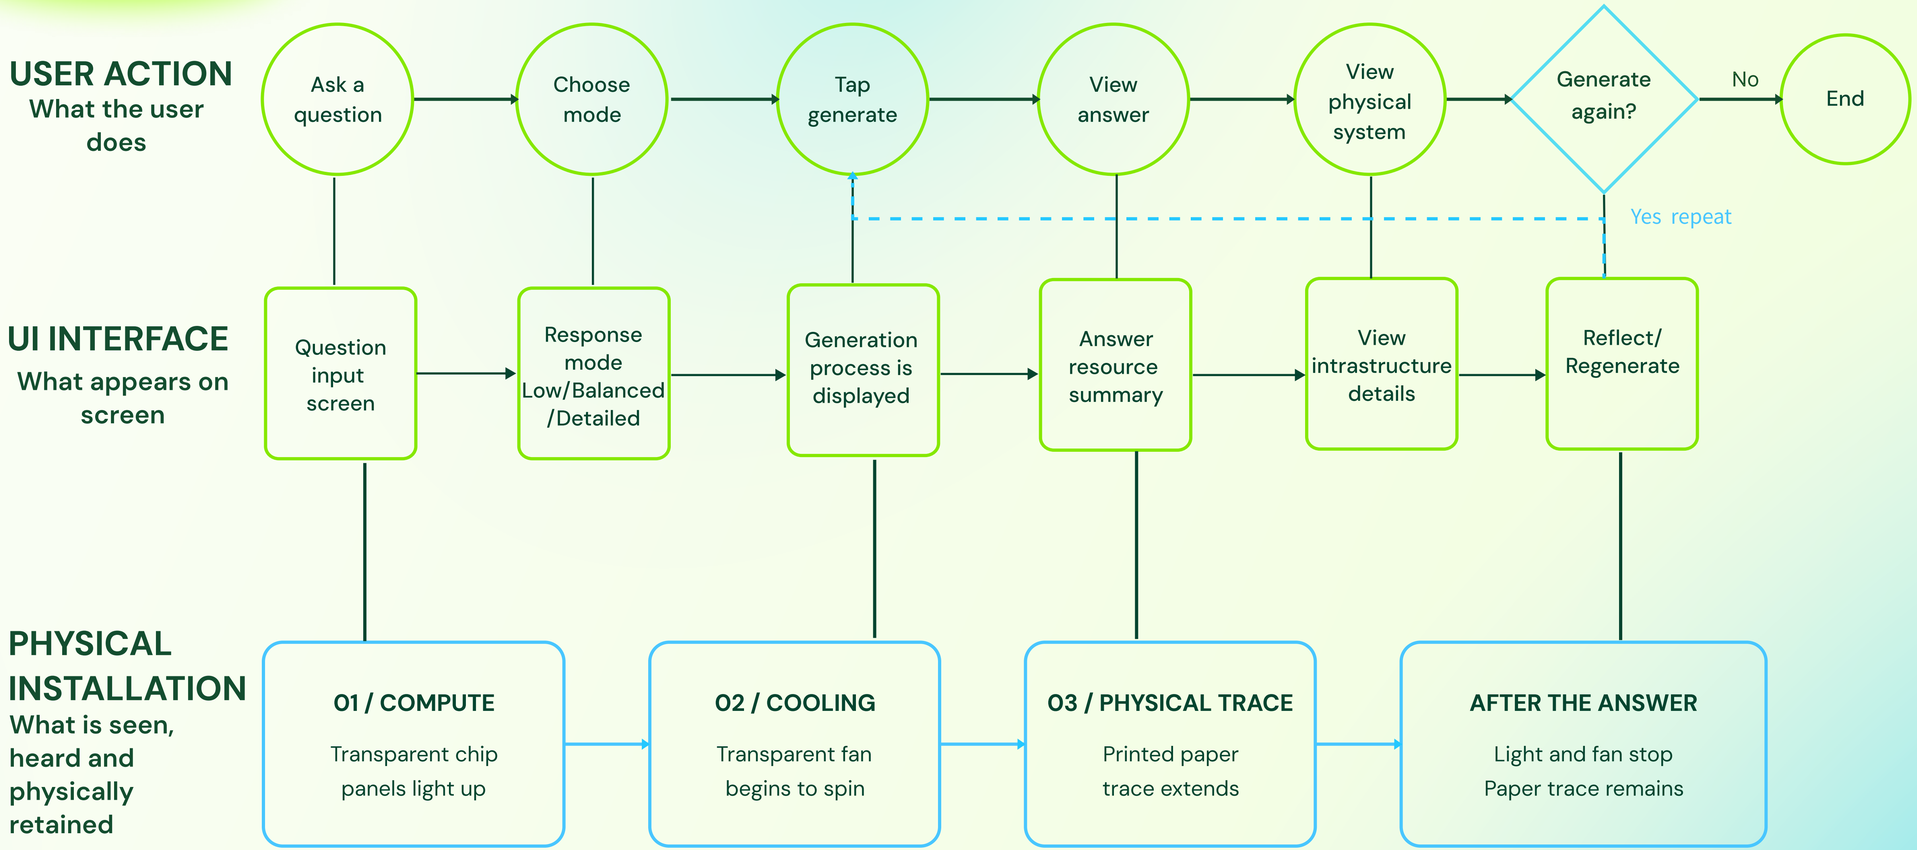

Visible

Tangible

Accumulative

Non-judgemental

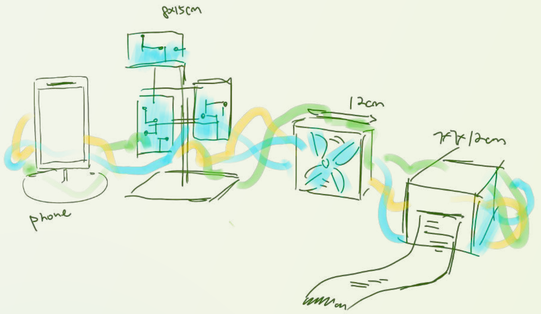

User Flow

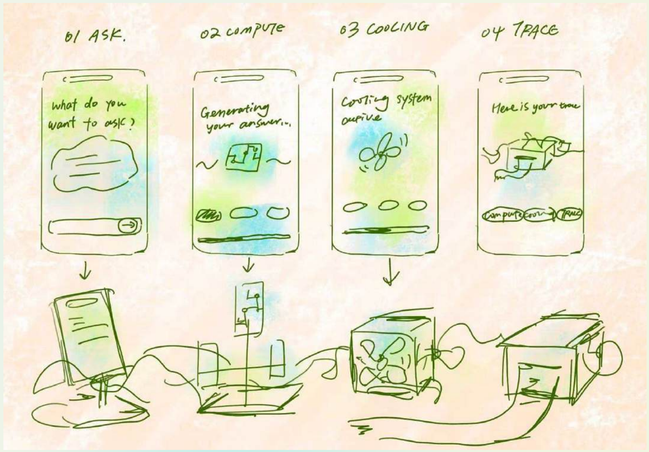

*Each new generation extends the accumulated physical trace

Concept Sketches

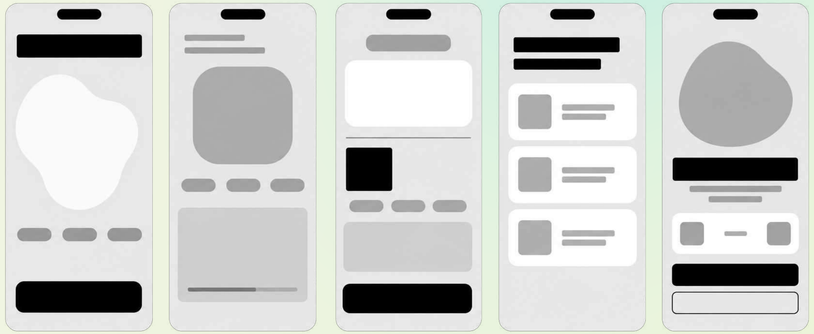

Concept sketch

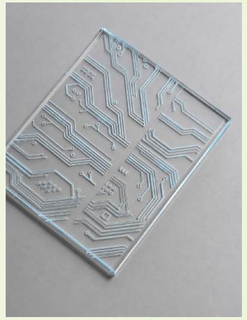

UI × Physical Mapping

Prototype

Materials

On the transparent acrylic board, there are patterns resembling circuits, symbolizing the previously imperceptible computing process. Combined with flexible pipes, LED lighting, transparent fans, mesh sleeves, wires and heat-sensitive paper, this device converts computing, cooling and data transmission into visible and touchable physical feedback.

Interaction Logic

"Beyond the Interface" explores the extension of digital interaction beyond the screen. This prototype design uses Arduino to coordinate three anticipated physical feedback forms: an illuminated circuit board to represent the computing process, a rotating fan to indicate the cooling status, and a thermal-sensitive printer to produce lasting paper traces. The lights and the fan should return to idle state after each response, while the printed traces persist and accumulate.

This mechanism aims to transform the previously intangible digital infrastructure into visible, audible, and tangible feedback, without judging the user's operational behavior.

```
void setup() {
  pinMode(LED_PIN, OUTPUT);
  pinMode(FAN_PIN, OUTPUT);

  Serial.begin(115200);
  Serial2.begin(9600);
}

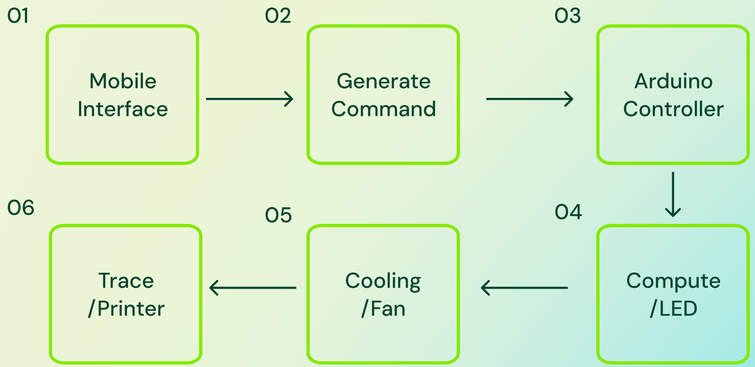

void runInteraction() {
  digitalWrite(LED_PIN, HIGH);
  delay(1000);

  digitalWrite(FAN_PIN, HIGH);
  delay(2500);

  Serial2.println("RESOURCE TRACE");
  Serial2.println("A generated answer became physical.");
  delay(800);

  digitalWrite(LED_PIN, LOW);
  digitalWrite(FAN_PIN, LOW);
```

Controls

PRIMARY ACTION SECONDARY

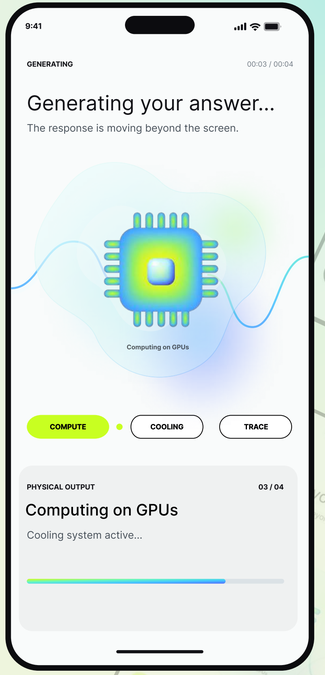

Fluid gradients, transparent forms and high-contrast controls visually connect the interface with the physical installation.

Final Interface

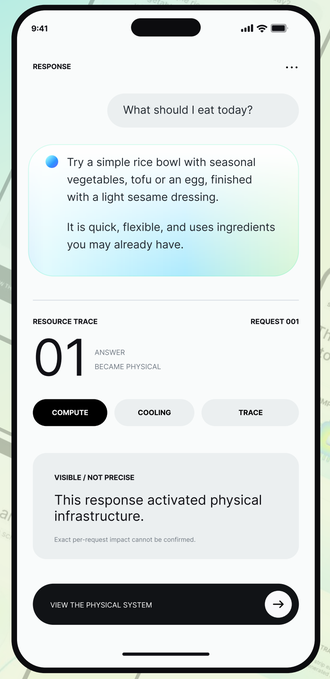

01 / ASK

Enter a question and select a response mode.

02 / GENERATING

Computation becomes visible as the physical installation activates.

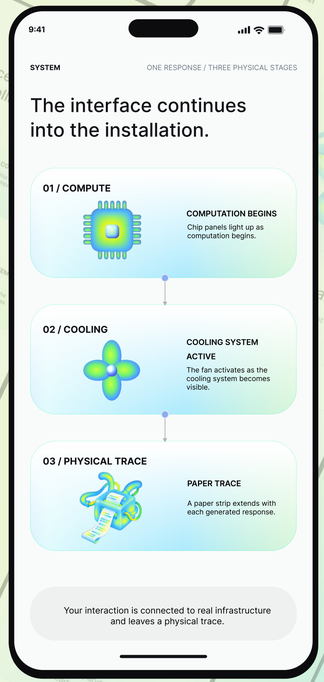

03 / RESPONSE

The answer appears alongside a summary of its physical trace.

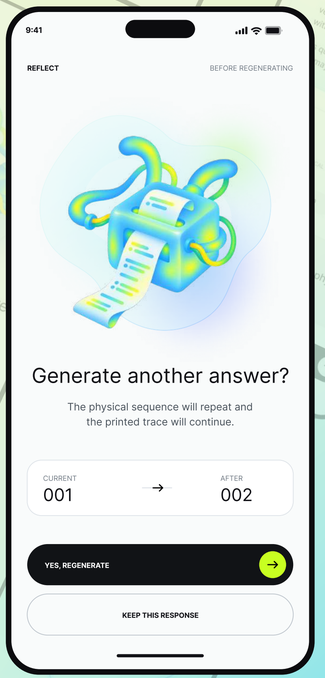

04 / PHYSICAL SYSTEM

Computation becomes visible as the physical installation activates.

05 / REFLECT

The user considers generating again as the paper trace accumulates.

Memorial Grove

Project type: App Design

This project addresses the fading of traditional Chinese funerals and lack of death education, which have led to the gradual forgetting of the deceased. The app allows users to preserve memories of lost loved ones on a private platform, featuring virtual gardens, 3D memory scans, and life trajectory records. VR can project these memories into reality, making remembrance tangible. The goal is to encourage people to confront death, cherish life, and use love and memory as an emotional bridge connecting family and life.

History Background

Burial

[Middle Paleolithic]-[Ming and Qing Dynasties]

Burial is the most common form of burial. Influenced by Confucianism, the scale and form of a funeral represent filial piety, so traditional funerals are often grand.

Traditional sacrifice

[Ming and Qing Dynasties]-[Until now]

The custom of "three days before and four days after" refers to honouring ancestors by burning incense and paper offerings around traditional festivals, but these practices carry various hazards.

Modern funeral

[From now on]

Since the funeral reform in 1956, the aging population has led to tight land resources, high traditional funeral costs, and death has become a highly profitable industry.

Online sacrifice

[From now on]

During the epidemic, the country advocated online sacrifices, which not only met the needs of commemorating ancestors but also reduced environmental pollution and expenditures. But the degree of acceptance still varies among different groups of people.

Interview

I interviewed some people and found that the interviewees all expressed helplessness and confusion in the face of death. They missed the past and longed for family unity. At the same time, they often felt unacceptable sadness and regret, especially for not being able to cherish the time spent with their loved ones.

Tong 7 Student

After being diagnosed with liver cancer, father passed away suddenly within a year. Tong, still young, couldn't grasp the concept of loss and often mentioned him. Mother, unsure how to explain death, could only say he wouldn't return from the hospital. Now, Tong's working mother hopes to preserve their shared memories, determined to maintain the family's unity.

Huang 20 student

Her friend passed away from breast cancer. Just a week prior, her friend was active on social media. The sudden loss surprised everyone. Due to divorce, her friend's young son, who had just started primary school, now lives with his grandparents. As he grows up, memories of his mother will gradually fade.

Celia 31 Staff

At the age of 26, when I was seven months pregnant, my mother passed away. I didn't cry because I believed my mother was finally relieved from the pain of illness. Fifteen years have passed, and I rarely bring up this experience, but there's always a place in my heart reserved for my mother.

Hazel 45 Staff

After many years of not returning to my hometown, I decided to visit my elderly relatives, only to encounter the coronavirus. Despite my recovery, my grandfather passed away due to the pandemic. He raised me since childhood, and we shared a deep bond. After living apart, we rarely had the opportunity to take photos together, which has become my eternal regret.

Summary

We avoid discussing death because it's difficult to accept the sadness of loss. In today's fast-paced world, reminiscing has become a luxury, and changing mourning practices limit emotional expression.

In China, this avoidance leads to misunderstandings and confusion about death, affecting respect for life and communication between doctors and patients. Despite a lack of religious beliefs, there remains a strong belief in ghosts and spirits.

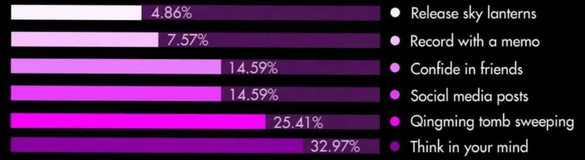

Design goal

The majority of modern individuals tend to employ dispersed methods of memorialization, which offer convenience and diverse means of expression. However, this approach comes with drawbacks such as dispersed information and a certain risk of privacy breaches. Moreover, individuals on social media platforms may not always find understanding. Having a dedicated platform specifically designed for this purpose could potentially be more advantageous for integrating and managing these emotions.

Questionnaire

After conducting a round of research, I sent out some questionnaires to investigate whether people have the habit of using similar software or if they need similar software for recording purposes. In total, 183 questionnaires were collected.

Common methods of expression used

53.55% Would choose to express missing someone on social media.

If there was an app specifically designed for storing longing would you use it?

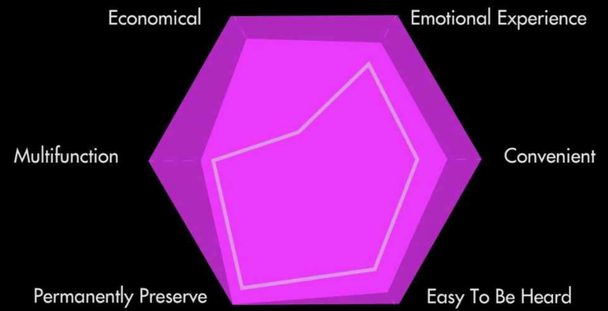

Summary

The survey indicates that the majority of people are still interested in this app and are willing to give it a try. Most individuals currently lack this habit mainly due to limited awareness, relying more on scattered recording methods. However, organizing these scattered records poses challenges.

Analysis

- The fit of the app to the pain point of the moment
- What this app plans to do

Design concept

This app, based on a garden concept, allows users to express their emotions privately or publicly by planting and collecting memories. It combines 3D modeling technology to provide users with a more intuitive experience of their abstract thoughts. Additionally, it offers 3D scanning functionality to permanently preserve lost items or buildings. The software strikes a balance between privacy and public interaction, creating a platform to concentrate memories, catering to personalized needs, and ensuring emotions are permanently stored in the digital world.

User Journey Maps

I have collected some users' current situations regarding how they express longing

Phase	Longing Phas	Expression Sharing Seeking Comfort	Memory	Acceptance and Moving Forward
Doing	Express on Social Platform	Seeking Willing Listeners	Tomb-sweeping	Memoir recording
Touch Point	1 Online platform 2 Social network	1 Social media 2 Internet 3 Phone fax 4 Text message 5 Face-to-face	1 Cemetery 2 Ritual goods shop 3 Department store 4 Flower shop 5 Vehicles	1 Notebook 2 Cell phone 3 Social media 4 App
Emotions				
Pain points	1 Emories dispersed 2 Not necessarily someone suitable to listen 3 Few apps like this, 4 Limited functionality	1 Not necessarily someone suitable to listen. 2 Friends may not always be available to listen anytime, anywhere	1 Environmental concerns, 2 Restrictions of new regulations on traditional tomb-sweeping customs 3 Long distances requiring special time arrangements 4 Not economical	Lack of communication
Opportunity	1 Content centralized 2 Less prone to loss, 3 Easy to retrieve	You can precisely allocate the specific group you want to confide in	1 Compliant with government regulations, 2 Economically convenient, 3 Easy to express oneself 4 Friendly to those not adept at socializing, 5 Offers some level of privacy 6 Respects individual feelings	1 Can communicate with people who share similar experiences 2 Fostering resonance

Personas

Name: Ming Zhao
Age: 28
Occupation:Soft ware Engineer

User Description:
Zhao Ming is a Chinese engineer working in the United States. Most of his family and friends are in China, but his closest grandmother passed away after he left China.

User Pain Points:
It's difficult to share longing for his grandmother with family and friends. He can use this app to share photos and memories of her, allowing members of his transnational family to participate in commemorating her

Opportunity:
1 Users can communicate and share in real time with friends.
2 Overcoming distance barriers.
3 Real-time sharing of photo albums.
4 Personalized control over shared recordings.

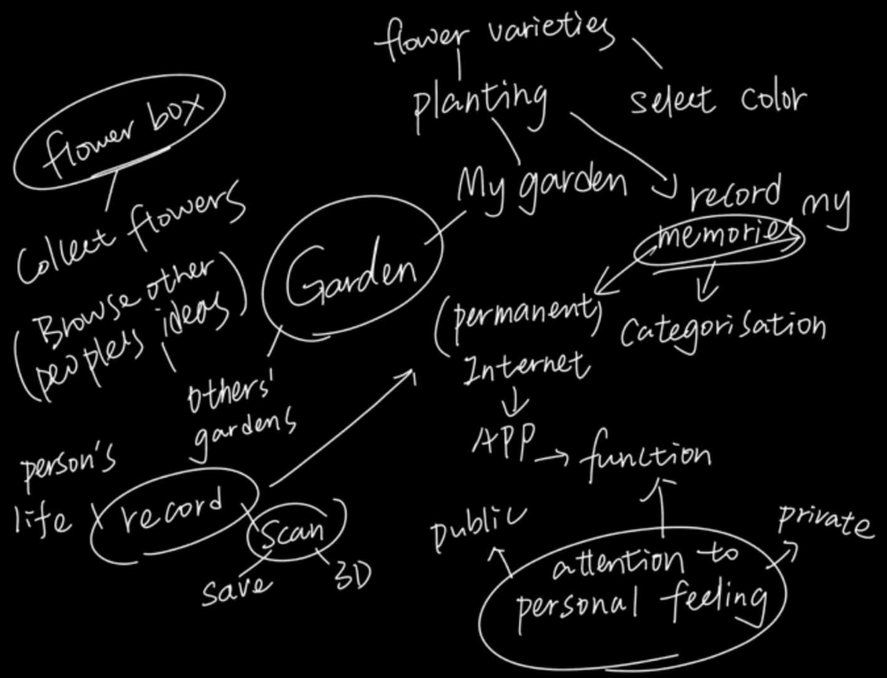

Name: Wen Zhang
Age: 37
Occupation:Fund Risk Manager

User Description:
Ms. Zhang is a very busy young very busy young person, and due to constraints in her workplace and time schedule, it is difficult for her to go to specific places regularly to participate in worship activities

User Pain Points:
She finds it difficult to return to specific locations for ancestral worship, but sometimes she deeply misses her deceased relatives. With her hometown house demolished, fulfilling her need for nostalgic remembrance by going back is also impossible

Opportunity:
1 House and item scanning
2 Saving and archiving: Users can archive them in the cloud or on local devices for easy access and viewing at any time.
3 Permanent preservation
4 User-friendly interface for easy operation

Mind map

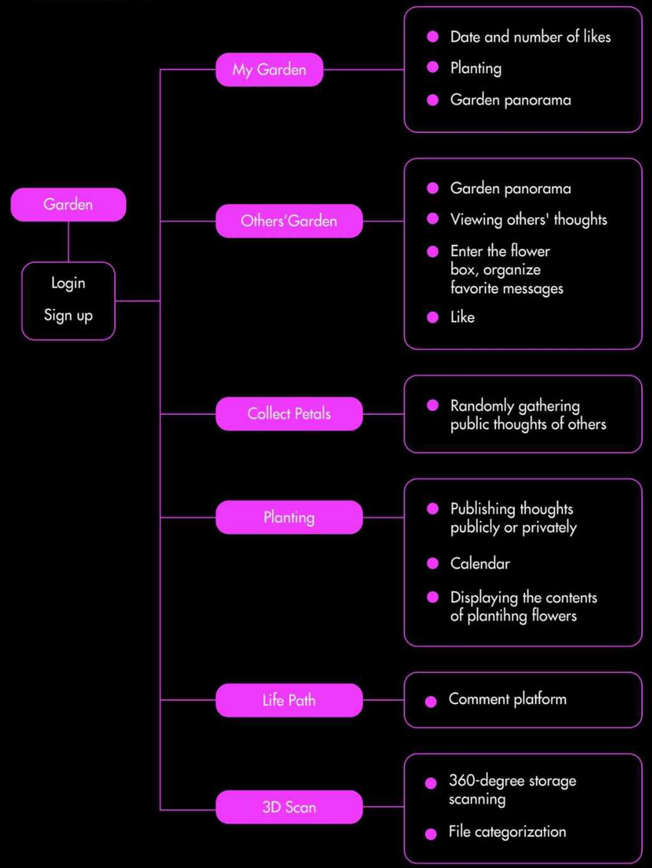

Summary

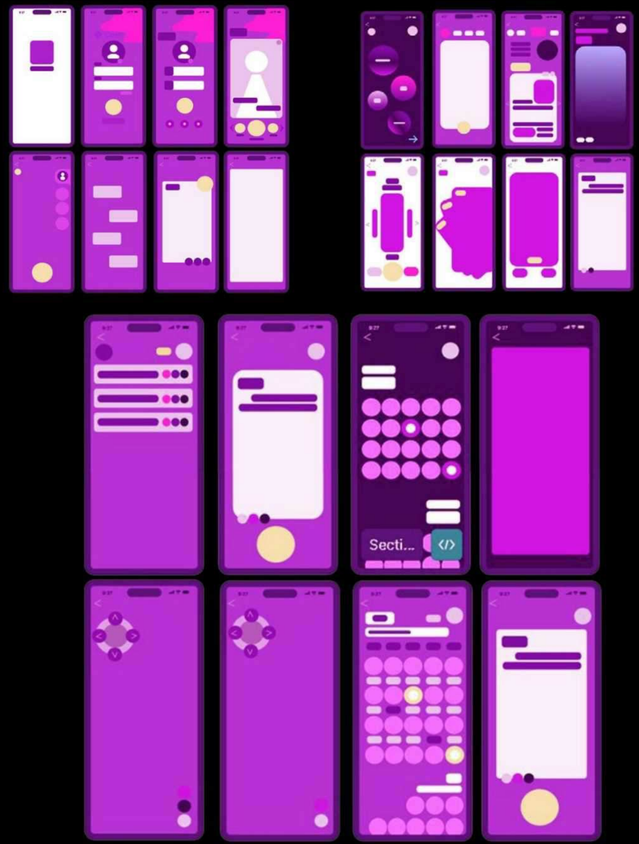

The application could be named "Mindscapes". It provides a platform for users to express their thoughts primarily through virtual gardens. It also features functions such as 3D scanning to preserve memories and track life trajectories. It fully respects user privacy, preserves precious memories, and allows for the expression of longing for deceased moves ones.

sketch

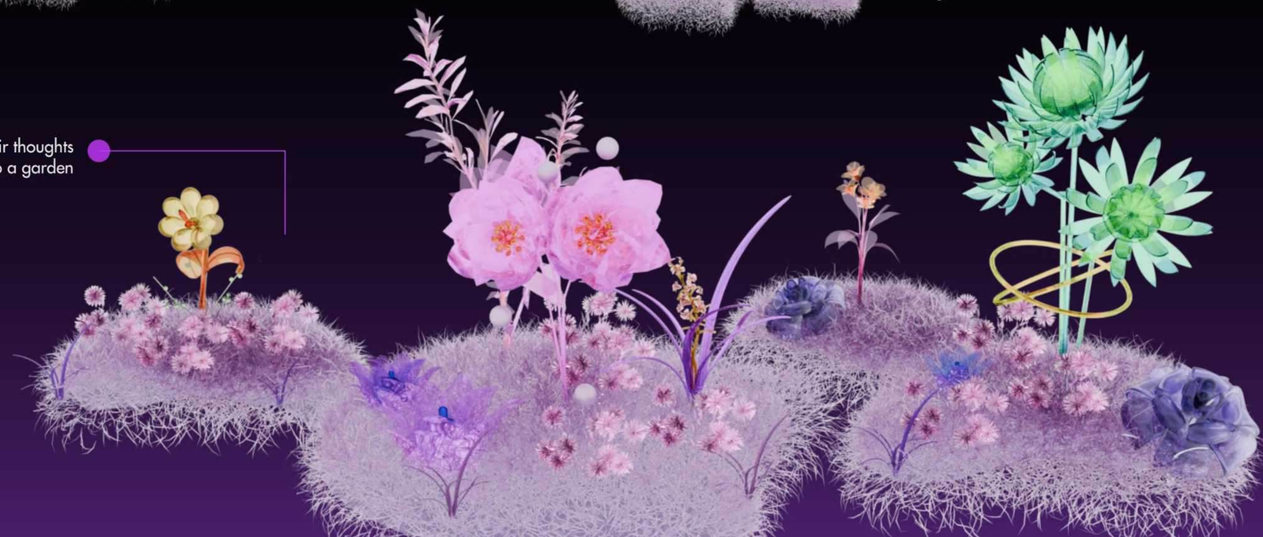

In the early stage, users were given a piece of land to hold memories of their loved ones.

When they record a thought, it becomes a flower and is planted in the garden.

Eventually their thoughts spread into a garden

Final Outcome

This app provides a platform for expressing thoughts, primarily through a virtual garden. It also features functions such as 3D scanning to preserve memories and recording life trajectories. It fully respects user privacy, preserves precious memories, and expresses thoughts for those who have passed away.

The original intention behind designing this app was to provide every ordinary person with a systematic place to store memories, ensuring that precious memories no longer fade away but are well preserved, allowing love to continue, and serving as a bond connecting family, friendship, and life.

Final Outcome

Enter my garden and browse the flowers you have planted. The flower basket in the lower right corner is a collection of thoughts. You can see the thoughts you have liked. The flower symbol allows you to directly plant your thoughts and express your current thoughts publicly or privately.

When you approach a flower while browsing My Garden, the date it was planted and the number of times it was liked are displayed above the flower. When browsing someone else's garden, the location and time are shown.

Tipping point

Project type: Vr card game. Exhibition design

This VR card game focuses on the complex relationship between urban culture, technological development and the environment. It shows the balance and constraints among technological progress, ecological protection and human well-being by simulating dealing with various problems encountered in urban development and exploring how to develop a city where all three aspects can develop together. Through a visually immersive experience, it triggers thoughts on sustainable futures and the balance between economic growth and environmental protection..

Research

Background

The prosperity of a country is often accompanied by environmental pollution and resource consumption. Urban planning needs to balance economic development and ecological sustainability. Scientific and technological progress brings both challenges and solutions, and in this process, it is particularly important to balance the relationship between science and technology, environment and urban development.
I believe that human beings need to explore how to achieve symbiosis with nature, reduce harm to the environment and promote sustainable development while promoting scientific and technological progress. This reflection helps to understand the impact of human behavior on the environment and provides direction for future development.

Literature review

Shallow ecology

In 1972, Ness proposed the distinction between "shallow" ecology and "deep" ecology, quickly recognized by academia. Shallow ecology is characterized by complete separation of man and environment, human-centered. It believes human protection of environment is not for environment itself but because it has value to humans. It may be suitable for short-term use but will cause irreparable harm to non-renewable resources in long run.

The modern environmental movement

In Silent Spring, Rachel Carson attributes "stillness of spring" to human's conquering, controlling and shaping nature. She laments that as man moves toward conquering nature, he is on road to destruction of earth and life. Ironically, man takes great risks to shape nature as he wishes.

Summary

Through the simulation of urban development, explore the balance between technological progress, environmental protection and urban planning. It allows players to experience how to promote science and technology while thinking about how to coexist with nature and reduce environmental damage, and provides a platform for environmental enthusiasts and professionals. It promotes sustainable development and cultivates players' interest in urban planning and science.

Interview

Ms. Zhang
Age:32
Position: Teacher

We need to learn how to use technology to solve environmental problems instead of creating more of them. We can reduce the consumption of natural resources through eco-design and green technologies.

Ms Lee
Age:19
Position: Student

The development of science and technology has brought us many conveniences of life, but also some environmental problems. Humanistic care is indispensable in design because design is not only about function, but also about satisfying people's emotional needs and improving their quality of life.

Mr Wang
Age:47
Position: Staff

There is a contradiction between the development of science and technology and environmental protection. I think we need to enjoy the convenience of technology and at the same time, we should pay more attention to environmental protection and the relationship between people.

Design Concept

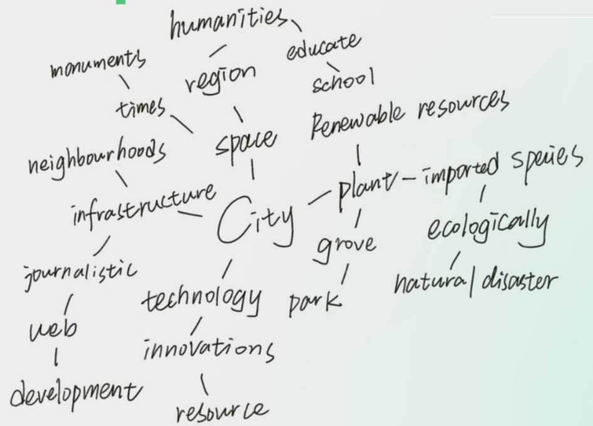

The card game focuses on the constraints of environmental protection, humanistic care and technological development in the context of urban planning.

The significance of this card game is to transcend the limitations of the professional field, not only for environmental organisations, high-level decision makers and professionals, but also to encourage ordinary people to participate in it.

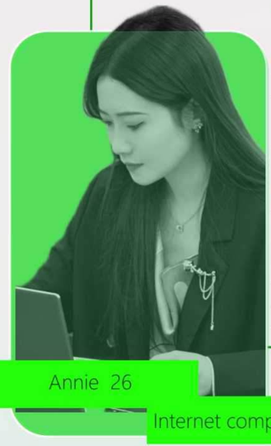

Through this game, we hope to urge people to care about the environment in their daily lives, so that even small actions can be converged into a force for change. As long as everyone has a desire to improve the planet, our world will be a better place.

Through the challenges and opportunities of simulated urban development, players will experience the impact of various choices on the environment, humanities, and technological progress or lack thereof, thus inspiring profound thinking and action.

Mind Map

Personas

Interests: Games, Reading

Needs: Wish to explore some knowledge related to environmental protection and some news events through games, and desire to contribute to environmental protection as much as I can in my career.

Pain points: Lack of in-depth understanding of environmental protection, and often feel that there is a disconnect between practice and theory. Don't know how to solve practical problems. Lack of effective ways to get the latest information on science and technology and environmental protection.

Annie 26

Internet company operations

Interests: Sports, Watching films, Playing games

Pain Points:
Work pressure and limited time . As a result, he doesn't have much free time to play long and complex games.

Needs:
He wants to experience the feeling of being in complete control of the city system, to gain decision-making power over the future development of the city, and to satisfy his interest in strategy and management.

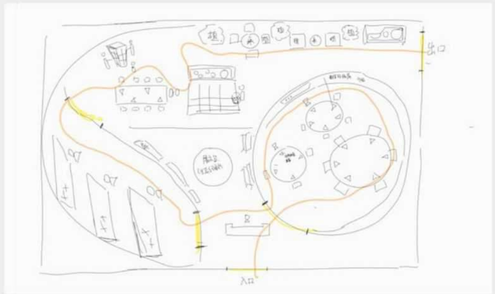

Andy 37

Creative Director

Exhibition

Sketch of the Exhibition

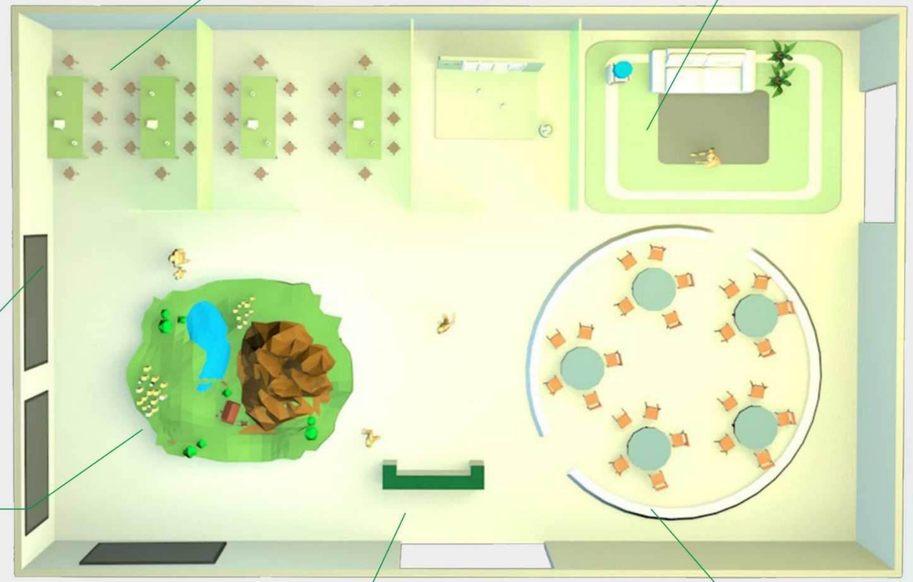

Game Zone

Glass Stickers: Handmade DIY environmentally friendly fridge stickers
Trash sorting: Put the corresponding balls into the appropriate sorting area.
Plastic Reconstruction: Make practical objects out of discarded plastics.

Lounge area

Comfortable chairs and tables for players to relax and socialize.

Major area

Video Explanation Area

Demonstrate the card game, its card design, story background, and so on. Tells the relationship between humanities, science and technology, and ecology.

Installation Display Area

Enhance the sense of immersion, attract players to participate in the interaction, provide space for discussion and stimulate the audience's senses.

Entrance and reception area

Installation of reception desk, guide signs and game profiles, provision of maps and information brochures.

Interactive Experience Zone

Offers a sampling experience of physical cards and digital versions of the game. Staff explanation.

Mobility Design

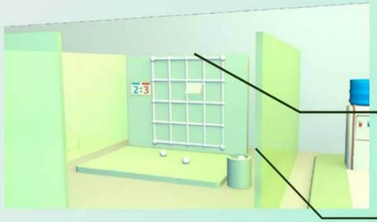

The overall dynamic design of the exhibition hall's moving line follows a gradual path from information acquisition to experience and deeper understanding. Visitors are always in a forward state, reducing the possibility of getting lost or repeating the visit.

Visitors in the exhibition hall go from a preliminary understanding of the background of the game, to a deeper understanding of the game world through the installation, to experiencing the game play. It is a gradual process.

Through these design elements and reasonable dynamic arrangement, it can not only effectively display the core content of the game, but also guide the audience to gradually deepen their cognitive interest in the game, and enhance the audience's sense of participation and interactivity.

Game Introduction

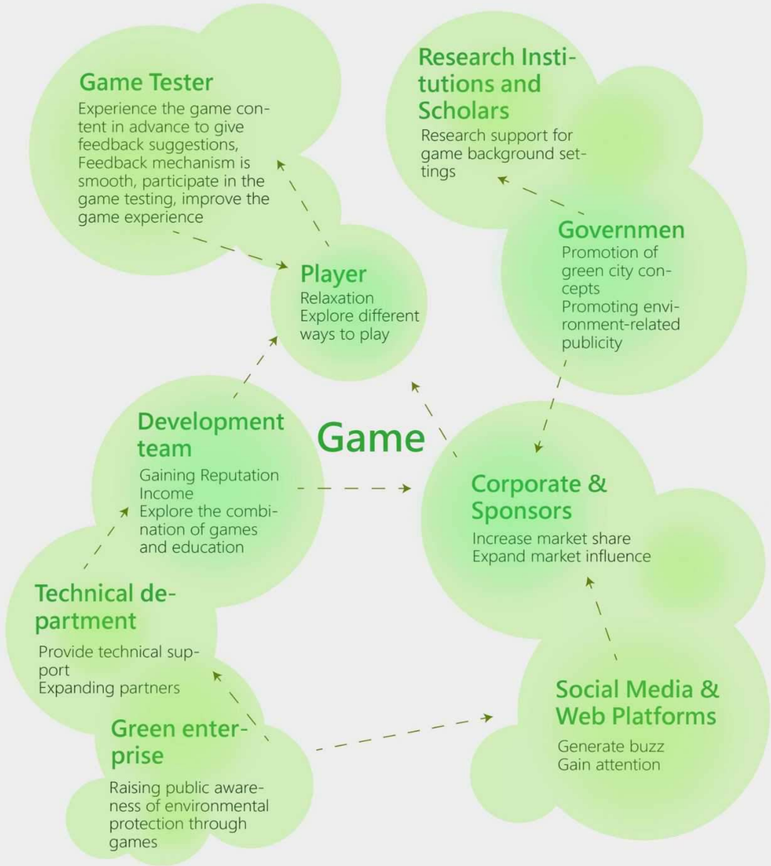

Rubbish Sorting

Score points by dropping the ball into the board you think is correct!

The winners can win a small gift from the staff.

Stakeholder Map

Game settings

1 Put on your VR device, find at least one friend and start playing anytime, anywhere!

2 Enter the game and choose your favorite character to represent yourself

3 Players are assigned in order of precedence by randomization within the system.

4 Each player starts with the same value of 3. The dice are then cast in order to determine the number of steps ahead.

5 At each stagnant step, players will face a choice and be randomly assigned "Question" cards.

6 Players add or subtract points by choosing randomly appearing questions, when the player chooses is not aware of the option AB add or subtract points, you need to judge for yourself.

7 At the same time there are 18 contingency cards that appear randomly in the middle of the random questions, and players can use the contingencies to increase or decrease their score, which adds to the uncertainty of the game.

8 The first player to reach the finish line represents the end of the round, at which point the system settles the scores for each player.

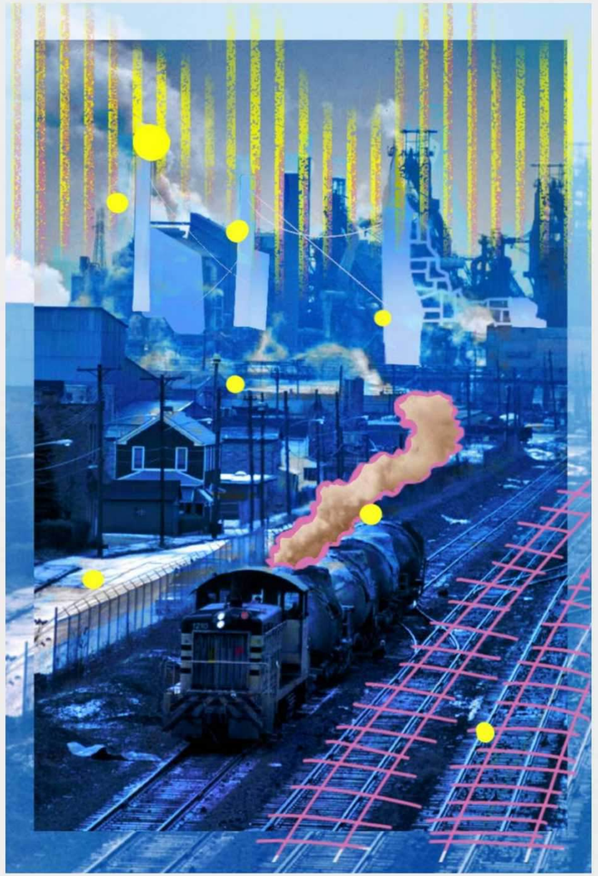

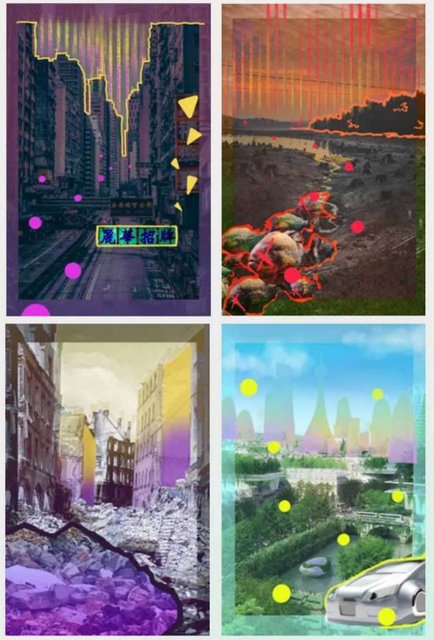

9 The player with the highest sum of all three scores wins the game.

Outcome

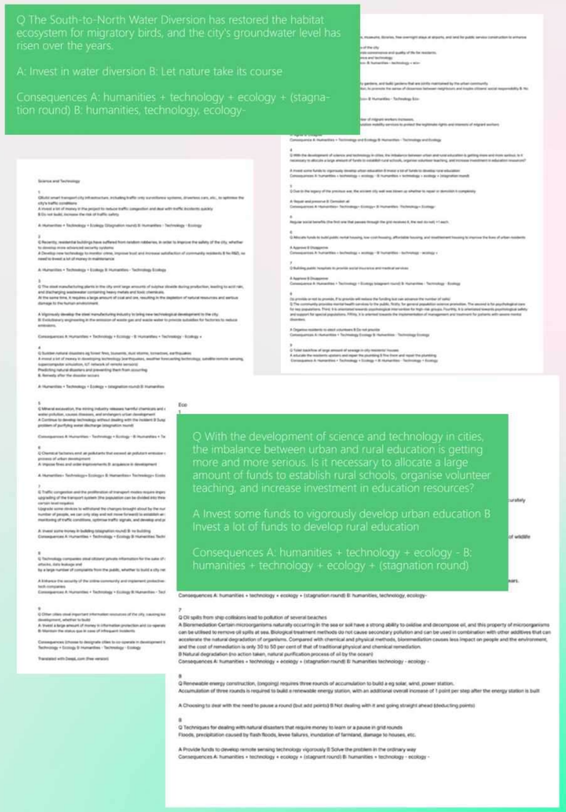

Ending Cards

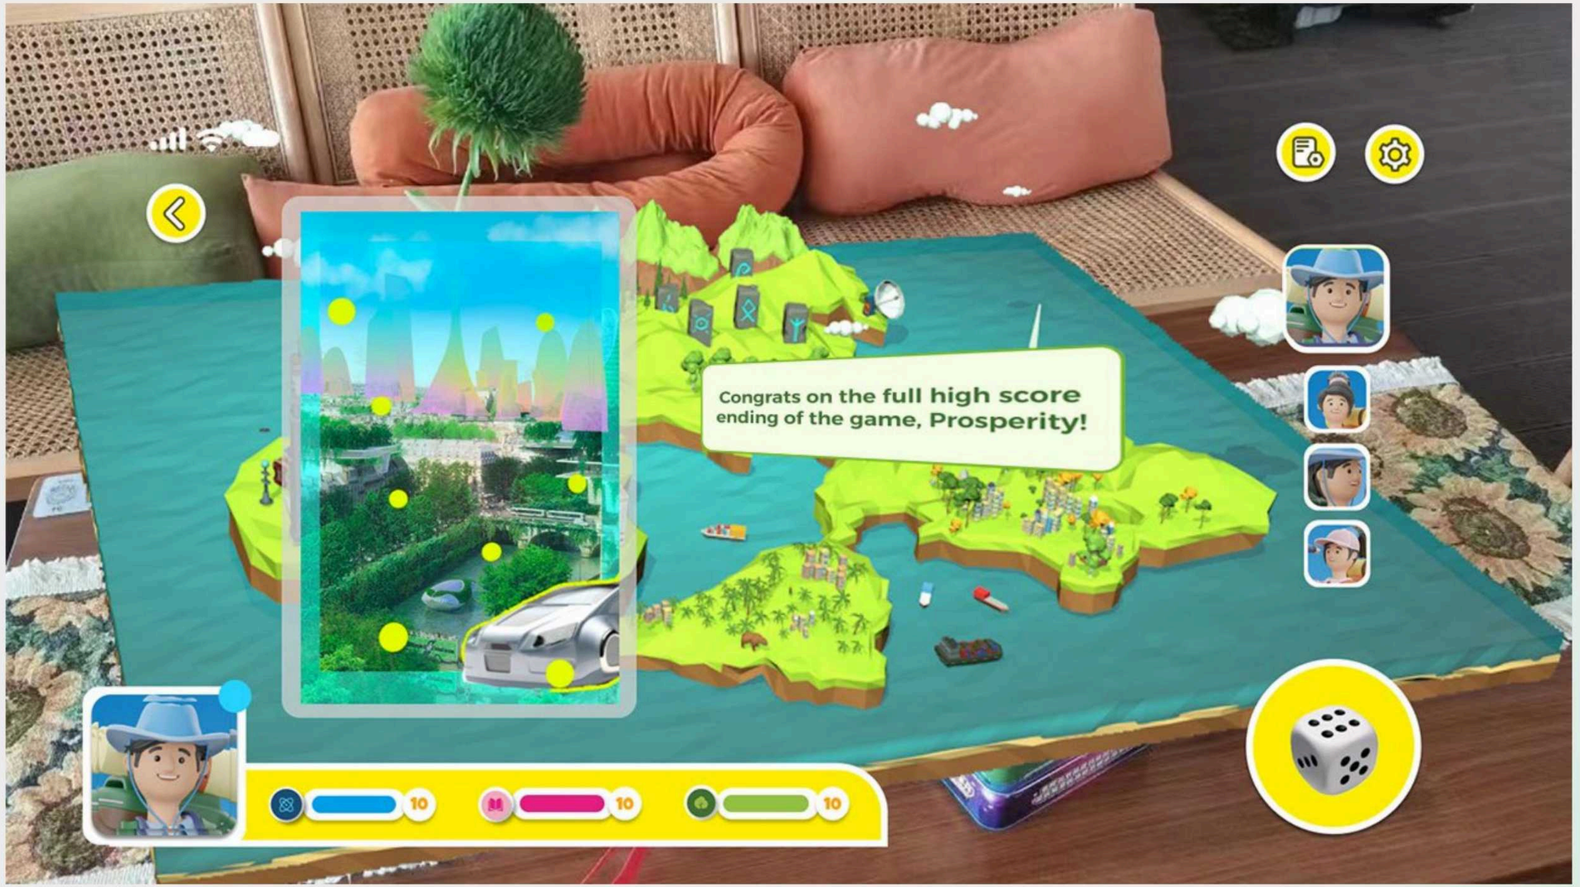

This game has five endings with corresponding scores presenting different ending effects and granting game cards. The "Prosperity Card Face" is awarded when a player's score reaches all ten points or more at the end of the game. The "Decline card face" is given when a player's score is the lowest in the game or below 0 points in each category at the end. The "Technology Decline card face" is earned when a player has the lowest Technology score among the three scores at the end. The "Humanities Decay Card Face" is received when a player's Humanities score is the lowest of the three. The "Eco Decay card face" is obtained by the player with the lowest Eco score among the three scores at the end. Players can accumulate different card face effects with each play.

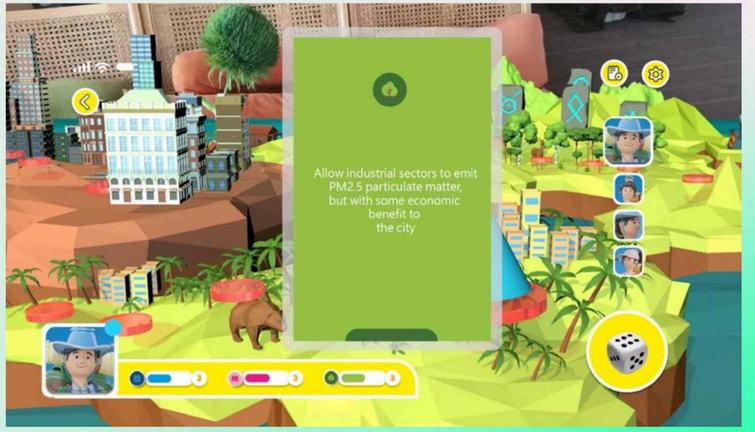

The basic title content of this game

Outcome

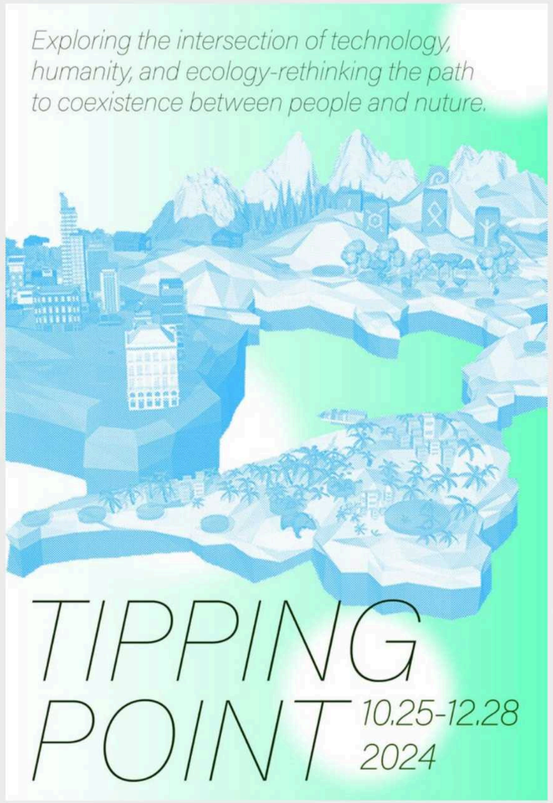

Congrats on the full high score ending of the game, Prosperity!

PUBLISHING FORMS: RADICAL EARTH

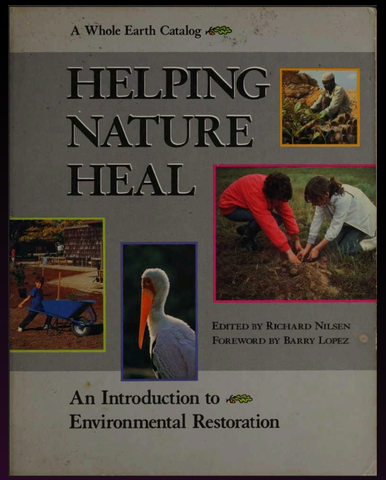

The Undead Repair Shop

Project type: Publication Design · Graphic Design · Pop-up Experience Design

Inspiration

A. Given Text

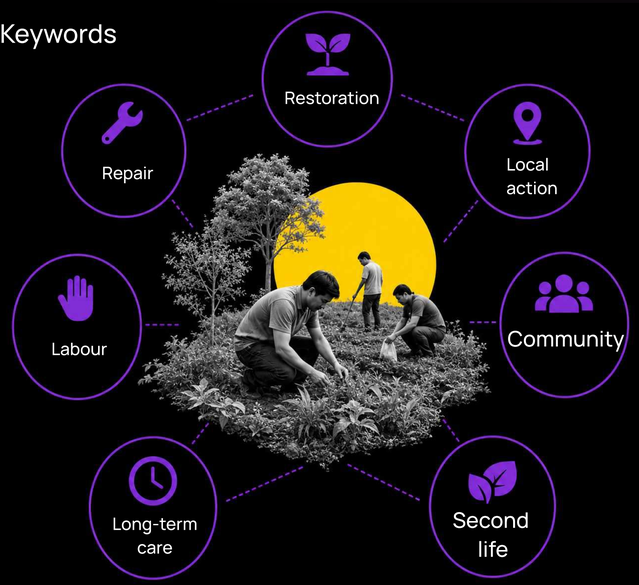

Helping Nature Heal: An Introduction to Environmental Restoration

This article defines environmental restoration as a long-term, practical, and collectively participatory conservation effort. It points out that restoration is not merely about repairing damaged land, but about rebuilding the relationship between people, communities, and the planet.

B. Thought

Long ago, the Earth had a closed, self-repairing energy cycle.
But humans turned it into a linear model: make, use, throw away.
We broke the planet's natural rhythm.
Restoration is not control. It is collaboration with nature.

Keywords

C. Real Story

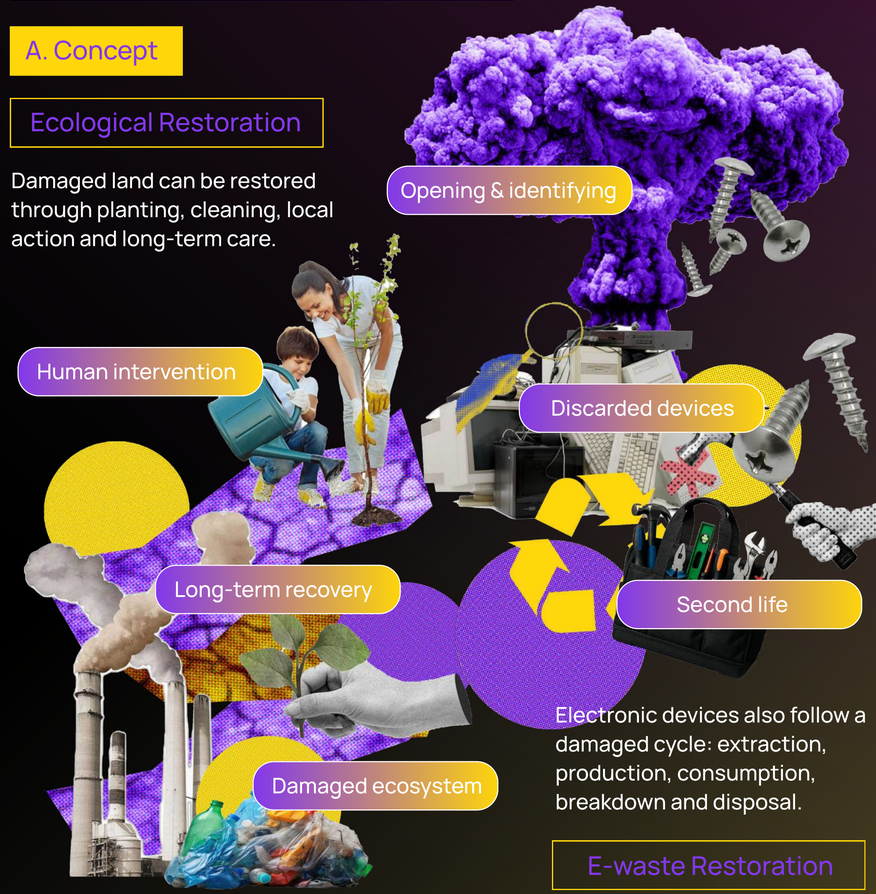

A true story inspired me: a girl repaired a broken Nintendo Switch and started a small repair business. It made me realise that e-waste is not useless, but locked knowledge.
Restoration is not simply returning things to their original state, but rebuilding relationships through continuous action.

Background Research

A. Concept

Ecological Restoration

Damaged land can be restored through planting, cleaning, local action and long-term care.

Electronic devices also follow a damaged cycle: extraction, production, consumption, breakdown and disposal.

E-waste Restoration

Interview

I interviewed three everyday users to understand how they respond to broken electronic products, repair, and e-waste.

Emma 22

I know electronic waste is harmful to the environment, and I feel guilty when I throw away old devices. But I usually do not know what else I can do with them. Even if some parts may still be useful, I cannot recognise them. Repair feels like something that requires professional knowledge, so I normally keep broken electronics in a drawer or eventually replace them.

→ Position: MA Design Student
Background: Uses laptop, phone and wireless earphones daily. Interested in sustainability, but has no repair experience.

Jason 24

When my electronic product breaks, I usually check the price of repair first. If it is too expensive, I would rather buy a new one. I do not really understand what is inside the device, and opening it feels risky. I am worried that I might damage it further, so I usually avoid repairing it myself.

→ Position: International Student
Background: Relies heavily on electronic devices for study and communication. Usually chooses replacement when repair feels too expensive or uncertain.

Mia 21

I think broken electronics may still have value, especially if some components can be reused. But the problem is that I do not know where to start. The inside of a phone or laptop looks complicated and fragile. If there were clear visual guidance or a simple way to understand each part, I might feel more confident to repair or reuse it.

→ Position: Undergraduate Student
Background: Uses second-hand electronics and is open to reuse, but lacks confidence in disassembling or repairing devices.

Persona

NAME	Alex
AGE	20
OCCUPATION	College Student

Pain Point

Wants to repair it but doesn't know where to start and is worried about damaging it.

Need

Wants a simple, visual, and non-intimidating way to learn how to repair it.

NAME	Ava
AGE	19
OCCUPATION	Design Student

Pain Point

I find electronic waste abstract and don't know what I can do with it.

Need

Want to understand materials and the culture of repair through an exhibition-style experience.

Experiments

Option A — Static Booklet
Clear and easy to distribute, but too passive for public participation.

Option B — QR
Can show animated repair steps, but relies too much on screens and lacks tactile interaction.

Option C — Repair Toolkit
Hands-on and practical, but too object-based and less connected to publishing as a shared experience.

Option D — Pop-up Repair Shop
Combines publication, space, objects and participation. It turns repair knowledge into a public experience.

Selected Direction: Pop-up Repair Shop
This format best supports the project's aim to make e-waste visible, readable, touchable and repairable.

Design Concept

The Undead Repair Shop

A pop-up publishing experience for e-waste restoration.
Broken electronics are reframed as "undead" objects — not finished, but unopened, unread and repairable.

01

Not a Shop for Buying

A shop that questions replacement culture rather than selling new products.

02

A Shop for Repairing and Reading

A place where visitors read devices through parts, materials and repair stories.

03

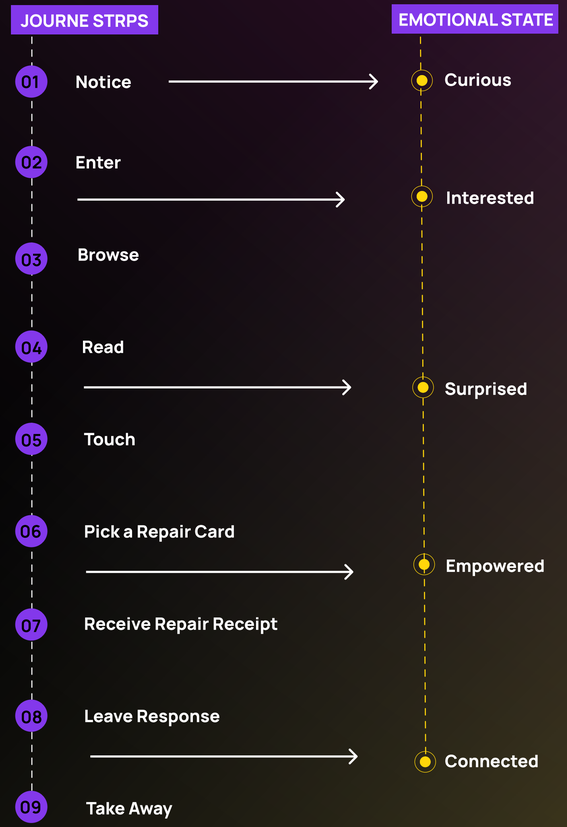

A Publishing Platform

A pop-up space that turns repair knowledge into manuals, cards, labels, objects and shared responses.

repair counter / exploded Switch poster / handmade zine / repair action cards / material tags / repair receipt / response wall

Outcome

Pop-up Shop Layout

Based on my personal conception and the experience process of the visitors, this visual display generated by artificial intelligence tested whether The Undead Repair Shop could function as a temporary publishing space. It demonstrated how to organize repair knowledge through display, circulation and printed materials, guiding visitors from the entrance, the item display area to the repair counter, the material story wall, and finally to the repair receipt area.

CONNECTED

Project Type:Book design,graphic design,utilizing typograghy,illustration design

Inspiration

Shenzhen, founded in 1980, is a new city. As a second-generation immigrant in Shenzhen, I find that Shenzhen immigrants face challenges in individual belonging and identity due to the rapid urbanization process and the gradual replacement of local culture.

1980 On October 8, 1990, the first McDonald's restaurant in mainland China opened in Shenzhen.

1990 Deng Xiaoping hoped that Guangdong's economic development could catch up with the four Asian Tigers within 20 years.

2000 Co-founded in November 1998, it is one of the largest integrated Internet service providers in China and one of the Internet companies with the largest number of service users in China.

2010 On January 16, 2017, the 392.5-meter-tall China Resources Headquarters became the tallest building along the Shenzhen Bay.

Definition of Belongingness

- **Language**

  Guangdong is a typical place where language is used for identity identification, sometimes even surpassing regional and blood ties.

- **Interpersonal Relationships**

  The sense of belonging is an essential component, shared experiences in a city, sharing the ups and downs of life, this process will establish strong emotional bonds among people.

- **Urban Culture**

  Shenzhen has only existed for 45 years today. People have collectively experienced the ups and downs of urban development with this city, fostering profound emotions and influencing their emotional attachment to Shenzhen.

- **Environment**

  The urban planning of Shenzhen predominantly features modern architecture, aligning with the architectural styles found in mainstream Chinese cities.

Basic Facts

RMB **1,974,149** billion

From 1917 to 2019, the company experienced growth.

The number of Fortune Global 500 companies in Shenzhen increased from

from 2016 to 2020.

209

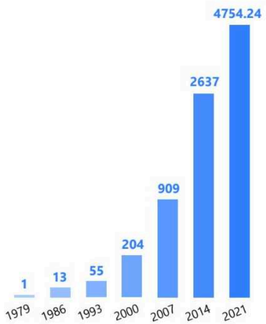

The number of sky-scrapers exceeding 200 meters in height.

The change in the resident population of Shenzhen from 1979 to 2019.

From Shenzhen Port, there are 241 routes reaching over 100 countries and regions. A shipment departing from Yantian to Los Angeles, USA, can arrive in as little as 12 days.

The trend of GDP in Shenzhen from 1979 to 2021 (billion US dollars)

Research

Interview

LUI
Age 23/student

As a second-generation resident of Shenzhen, I experience conflicting senses of belonging. While Shenzhen's local culture emphasizes efficiency and development, economic pressure and living costs pose challenges. The superior infrastructure and educational environment are admirable, yet the pressure persists, leading to a sense of uncertainty about belonging.

HUA
Age 26/staff

Shenzhen has been my home since I was born, carrying my memories. Childhood was filled with tutoring, extracurricular classes, and the stress of high school. During university, I only returned to Shenzhen during summer and winter breaks, always struck by its immense changes. Despite living here for so long, I can't claim to fully understand it. Yet, my hometown Heyuan remains eternally warm in my memories, devoid of pressure, filled with the warmth of family gatherings, where I felt cherished.

XIANG
Age 20/student

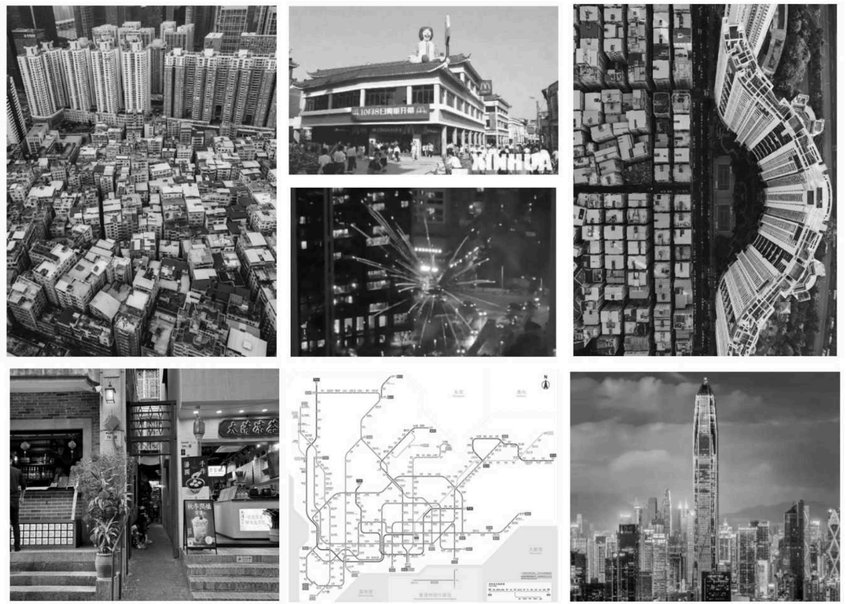

I am a second-generation resident of Shenzhen, and this city is my hometown. Although I don't speak Cantonese, Mandarin is commonly used for communication in school, which fosters a strong sense of belonging for me. Coming from an open-minded family with a high acceptance of new things, I consider the Shenzhen school uniform as a symbol, having worn it for 12 years. Shenzhen's culture is characterized by youthfulness and striving for success, offering a more relaxed and enjoyable atmosphere compared to Beijing. Other memorable aspects include Lianhua Mountain Park and the efficient government services.

Summary

The lack of a sense of belonging does exist, mainly stemming from factors such as economics, family relationships, and self-identity.

Observation

Here's my presentation combining field research and personal experiences, depicting Shenzhen's development over the past 40 years.

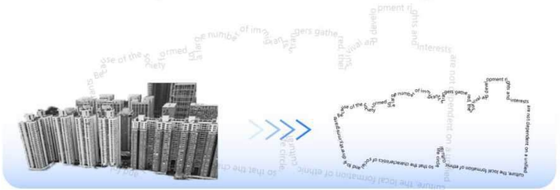

Insight

- Shenzhen achieves rapid urban transformation through infrastructure development.
- Coexistence of new and old housing.
- Urban design finds a balance between the old and the new, showcasing modernization while also preserving the city's history and traditions.

Design Process

Extraction

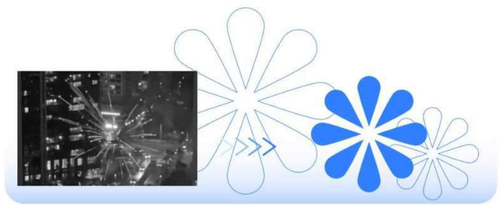

From past to future, I explore Shenzhen's cultural fusion and diverse demographics as an immigrant city. Thriving on people's movement, Shenzhen shapes generational destinies and a shared sense of belonging. This design incorporates South China, Minnan, and Cantonese influences, merging with my personal experiences to express a deep connection to Shenzhen. It captures both the city's culture and inclusive spirit, reflecting the bond between its second generation and the city itself.

Inspired by the contrast between urban villages and high-rises, I outline skyscraper contours with text to narrate urban village stories and depict the modern city's silhouette. This design embodies the fusion of tradition and modernity, reflecting Shenzhen's diversity and unique sense of belonging.

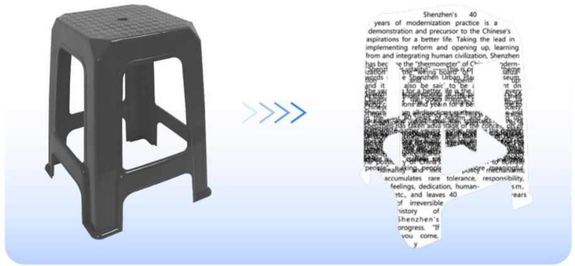

Using Shenzhen's metro lines as a medium, I connect the city's stories to each line, allowing flowing text to traverse the tracks and narrate Shenzhen's history and transformations. Each station not only continues a story but also embodies a sense of belonging and the spirit of perseverance.

During the New Year, Shenzhen feels quite empty, with only the malls bustling slightly. I noticed fireworks near residential buildings, adding a festive spirit to the quiet. Inspired by this, I incorporated fireworks into the skyscraper design to infuse warmth and vitality into the city's stillness.

Inspired by the photo of the first McDonald's in mainland China opening in Shenzhen, I use the silhouette of buildings in white space to showcase this historical moment, symbolizing the city's spirit of openness and innovation.

Almost every household in Guangdong has this type of plastic chair, embodying the warmth of everyday life and local culture. The cover features its iconic silhouette in blue, integrating it into the overall color scheme while symbolizing the warmth and humanity of life in Shenzhen.

During the New Year, Shenzhen becomes almost a ghost town, with a few residents setting off fireworks on high-rise balconies, adding a festive spirit to the cold city. The book transforms fireworks into graphic elements that adorn the silent urban landscape, conveying the warmth and humanity that still exist within the city's tranquility.

By comparing the development processes of China and Shenzhen, I collected the iconic buildings of Shenzhen and their completion dates since the reform and opening-up period, placing the classic slogan "Time is Money, Efficiency is Life" on this page. This design symbolizes Shenzhen's innovation and profound understanding of efficiency and opportunity.

Mian color

Blue symbolizes the connection between Shenzhen and the ocean, as well as the spirit of perseverance. As the primary color, it reflects Shenzhen's transformation from a small fishing village to a modern metropolis, encapsulating the spirit of every hard-working individual
